Observations

## The multi-scale physics of galactic star formation across cosmic time

**J. M. Diederik Kruijssen**  
MPA Garching

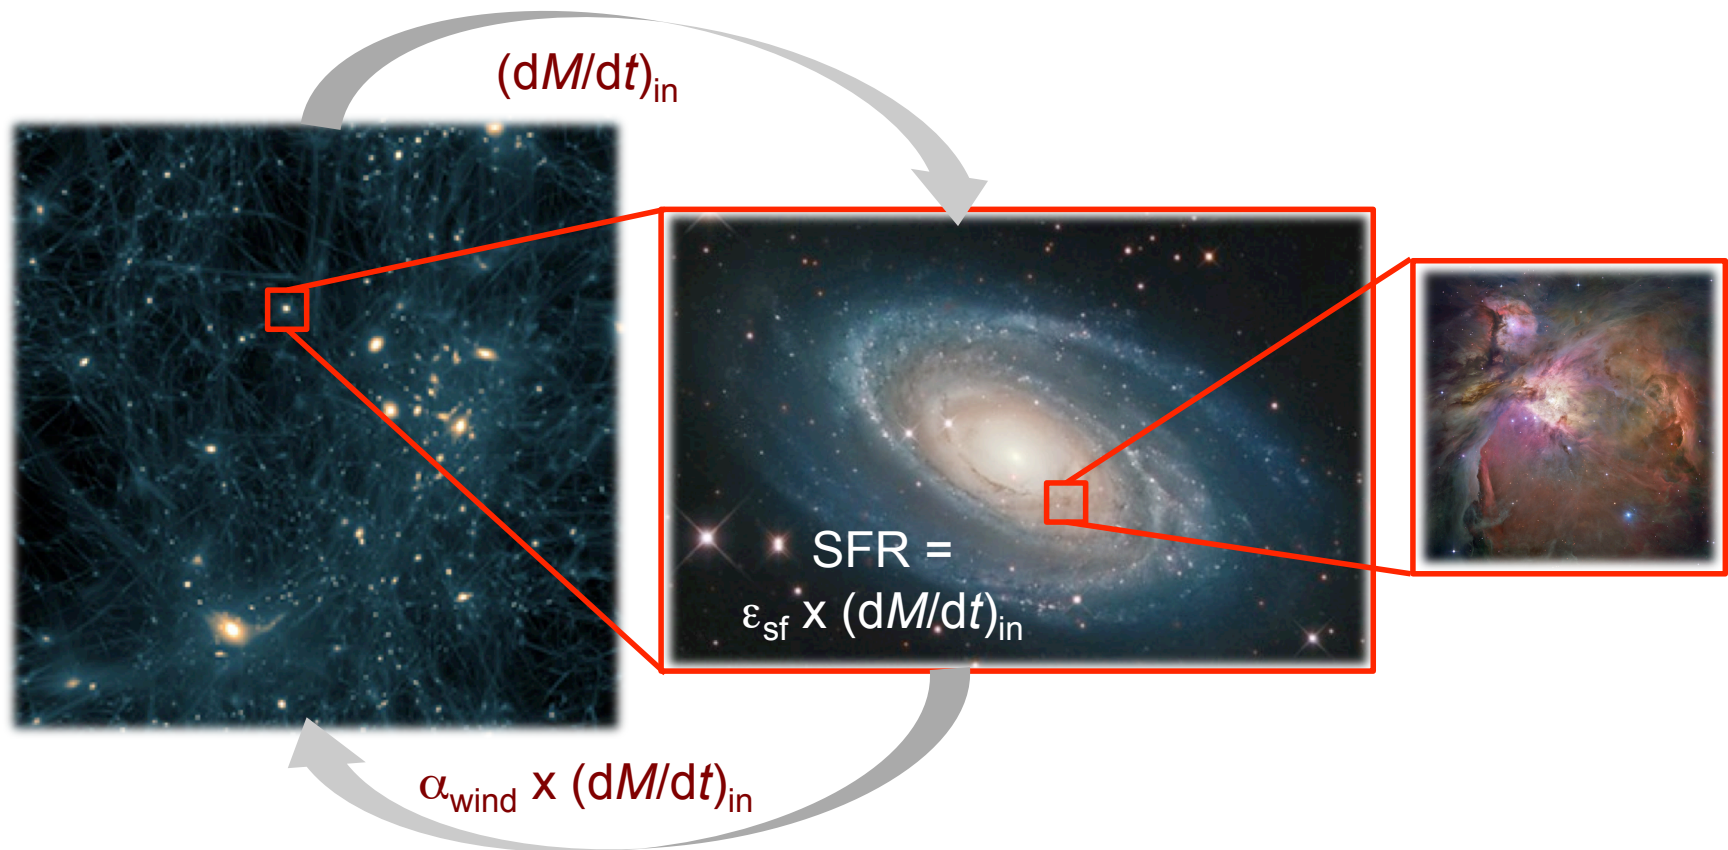

Introduction

Principle

Simulations

Observations

## Is the IGM driving star formation?

The constants contain most of the physics. As long as their origin is unknown, galaxy formation is unsolved – knowing the mass inflow rate is not enough.

Introduction

Principle

Simulations

Observations

## Star formation occurs in localised events

NGC 300, GALEX

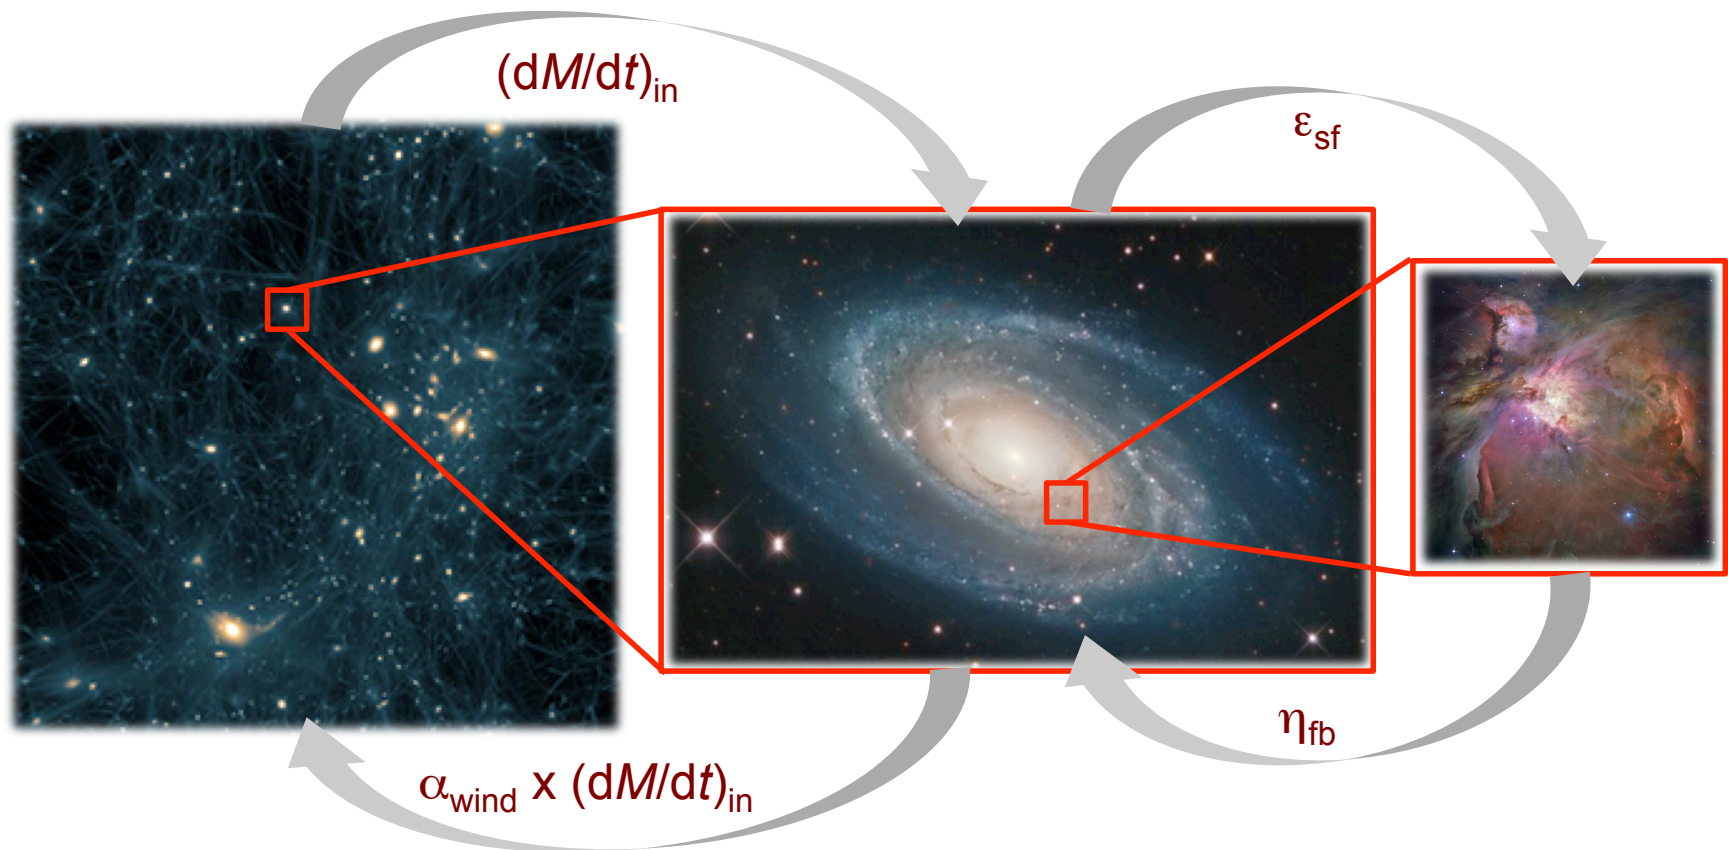

Introduction

Principle

Simulations

Observations

## Is the IGM driving star formation?

The cloud-scale quantities set the galaxy properties (see e.g. FIRE) but are unknown outside the Local Group. However, we have developed a new statistical method to systematically obtain them across cosmic time.

## An uncertainty principle for star formation – I. Why galactic star formation relations break down below a certain spatial scale

J. M. Diederik Kruijssen<sup>1★</sup> and Steven N. Longmore<sup>2</sup>

If a macroscopic correlation is caused by a time-evolution, then it *must* break down on small scales because the subsequent phases are resolved.

## An uncertainty principle for star formation – I. Why galactic star formation relations break down below a certain spatial scale

J. M. Diederik Kruijssen<sup>1★</sup> and Steven N. Longmore<sup>2</sup>

The *way in which* galactic star formation relations depend on the spatial scale is a direct probe of the physics of star formation on the cloud scale

# Multi-scale star formation across cosmic time

## Gas-to-SF tracer ratio ( $= t_{\text{depl}}$ ) as a function of spatial scale

# Multi-scale star formation across cosmic time

J. M. Diederik Kruijssen – Max Planck Institute for Astrophysics

Introduction

Principle

Simulations

Observations

## Gas-to-SFR ratio as a function of spatial scale

Kruijssen & Longmore 2014, MNRAS 439, 3239

Non-degenerate measure  
of the cloud-scale time line

## Gas-to-SFR ratio as a function of spatial scale

✧ Observations show the same behaviour

Introduction

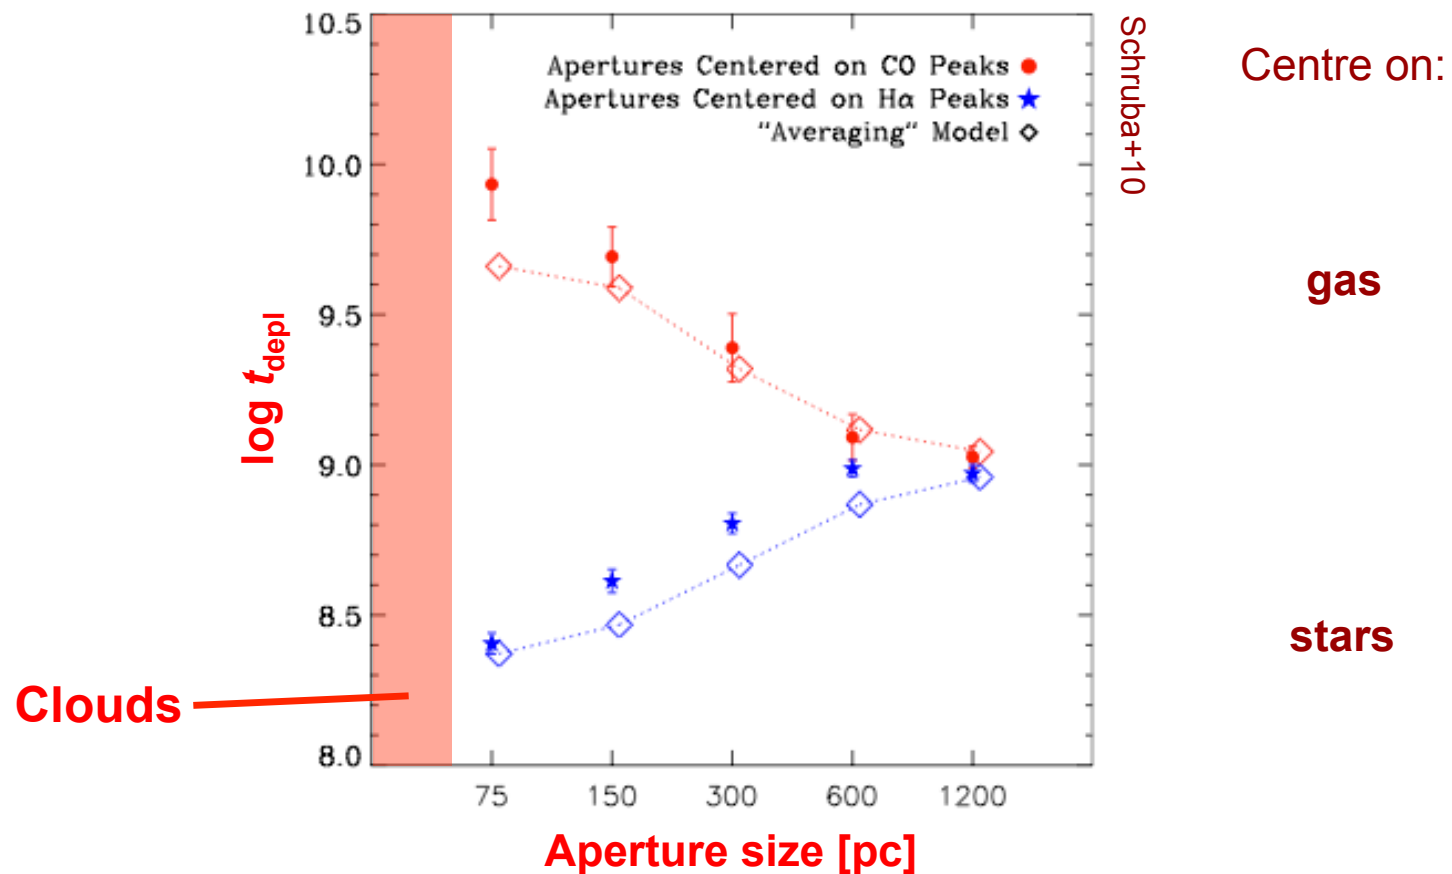

## Gas-to-SFR ratio as a function of spatial scale

✧ Imprint of condensations on size-scales  $\sim 5$  times larger

Principle

Simulations

Observations

## An uncertainty principle for star formation

Kruijssen & Longmore 2014, MNRAS 439, 3239

- ✧ Simple, but fundamental model describing multi-scale SF
  
- ✧ Potentially very powerful tool to obtain:
  - time-scales involved in SF process (cloud/clump lifetimes, FB timescale, ...)
  - cloud/clump separation length
  - star formation efficiency per cloud/clump
  - feedback velocity, mass outflow rate, mass loading, ISM coupling efficiency
  
- ✧ Improvements with respect to previous work:
  - self-consistently accounts for statistics → direct translation to time-scales
  - no need to resolve individual clouds → works out to  $z \sim 4$

## An uncertainty principle for star formation

Kruijssen & Longmore 2014, MNRAS 439, 3239

- ✧ Simple, but fundamental model describing multi-scale SF
  
- ✧ Potentially very powerful tool to obtain:
  - time-scales involved in SF process (cloud/clump lifetimes, FB timescale, ...)
  - cloud/clump separation length
  - star formation efficiency per cloud/clump
  - feedback velocity, mass outflow rate, mass loading, ISM coupling efficiency
  
- ✧ Improvements with respect to previous work:
  - self-consistently accounts for statistics → direct translation to time-scales
  - no need to resolve individual clouds → works out to  $z \sim 4$

This is what ALMA, MUSE,  
etc. are made to do

Simulations

Observations

## 3. numerical testing

# Multi-scale star formation across cosmic time

J. M. Diederik Kruijssen – Max Planck Institute for Astrophysics

Introduction

## How well does it work?

(Kruijssen, White, Schrubba, Hu, Longmore)

- ✧ Test using numerical simulations
- ✧ 'New SPH' code P-Gadget – see Chia-Yu Hu et al. (2014)
  - pressure-entropy SPH
  - Wendland smoothing kernel
  - improved artificial viscosity
  - artificial thermal energy conduction
- ✧ M33-like disc, resolution in clouds is  $< 20$  pc
- ✧ Age-bin the stars and use maps for tests

20 kpc

Principle

Simulations

Observations

# Multi-scale star formation across cosmic time

J. M. Diederik Kruijssen – Max Planck Institute for Astrophysics

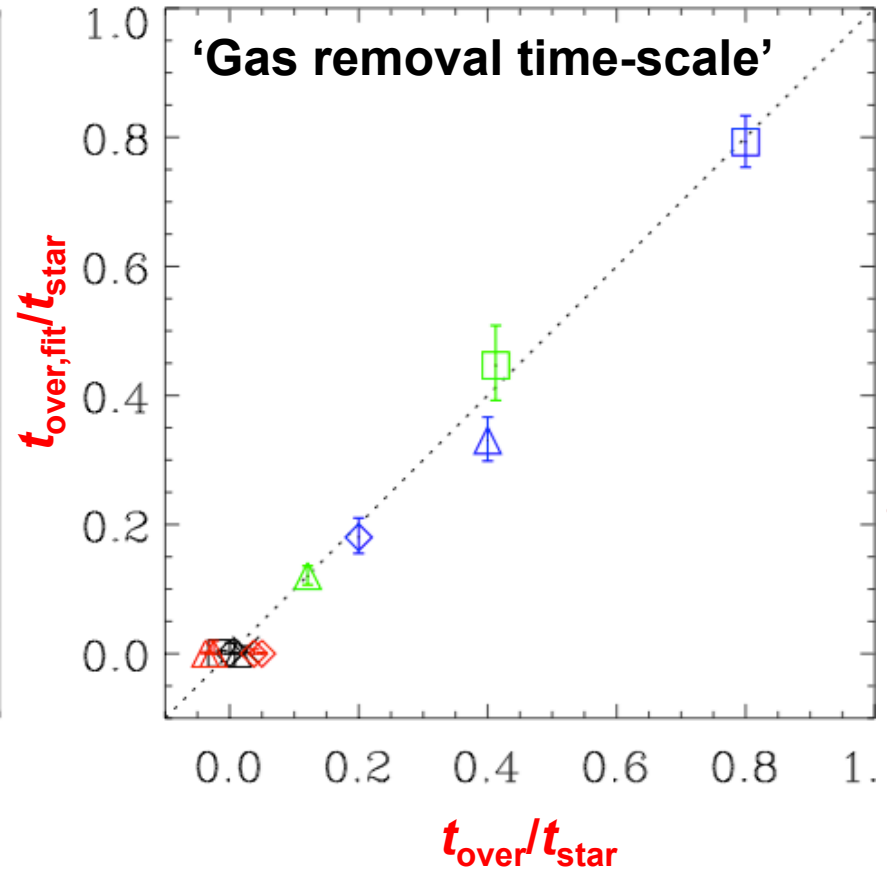

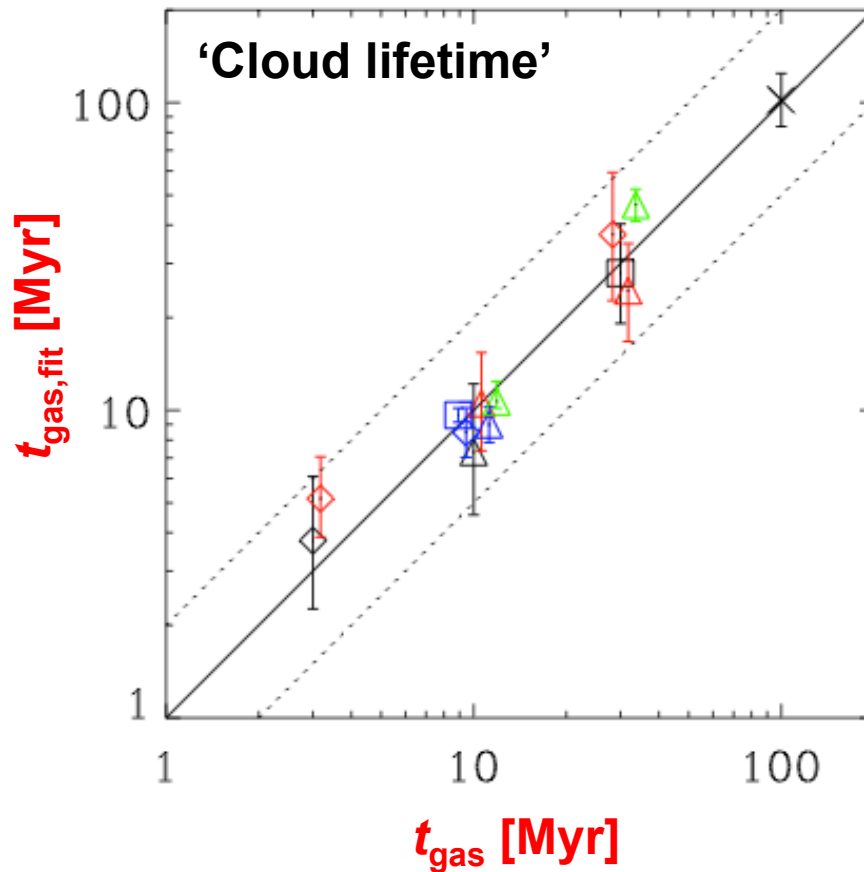

Introduction

Principle

Simulations

Observations

Current method is accurate to 20–50%

Kruijssen+, in prep.

# Multi-scale star formation across cosmic time

J. M. Diederik Kruijssen – Max Planck Institute for Astrophysics

Introduction

**First test passed**

Principle

Numerical simulations show that the method can  
be used to reliably measure tracer lifetimes  
– further tests are ongoing

Introduction

## Application to M33

✧ Using H $\alpha$  and CO(1-0)

Principle

Simulations

Observations

Kruijssen, Schrubba & Longmore, in prep.

For  $t_{\text{star}} - t_{\text{over}} = 6$  Myr:

$t_{\text{gas}} =$

$t_{\text{over}} =$

$\lambda =$

$\epsilon \sim$

$V_{\text{fb}} =$

$dM/dt \sim$

$\eta_{\text{fb}} \sim$

Stay tuned for the paper!

# Multi-scale star formation across cosmic time

J. M. Diederik Kruijssen – Max Planck Institute for Astrophysics

Introduction

## Representative number of nearby galaxies with in-hand data

- ✧ Enables *systematic* survey of cloud-scale star formation and feedback across a broad range of cosmic environments (rather than just Local Group)

Principle

Simulations

Observations

The number of galaxies will naturally explode during ALMA Cycles 3  $\rightarrow$   $N$

# Multi-scale star formation across cosmic time

J. M. Diederik Kruijssen – Max Planck Institute for Astrophysics

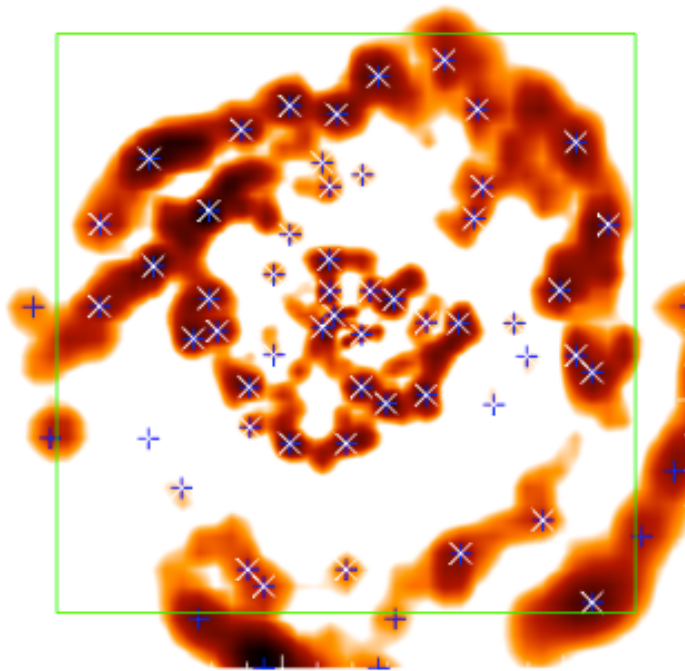

Introduction

Principle

Simulations

Observations

Method opens up entire observable Universe for cloud-scale SF studies

Low-resolution simulation

$$t_{\text{gas}} = 30 \text{ Myr}$$
$$t_{\text{gas,fit}} = 32^{+27}_{-12} \text{ Myr}$$

Hodge+12

Observed sub-mm galaxy CO(2-1)

$$z = 4.05$$

## Conclusions

- ✧ New method to measure fundamental quantities characterising SF & FB  
Kruijssen & Longmore 2014, MNRAS 439, 3239
- ✧ Enables cloud-scale SF studies over cosmologically relevant distances
- ✧ Numerical simulations show measured time-scales are accurate
- ✧ Quantities show environmental (in)variation: two galaxies already rule out universality of the cloud lifetime, SFE, feedback velocity, outflow rate
- ✧ Broad application only possible now with ALMA: systematically correlate cloud-scale quantities with host galaxy properties to constrain physics  
➔ exciting future ahead
